

## VARIATIONS ON THE FIBONACCI SEQUENCE

One of the best known mathematical sequences is that of Fibonacci .It reads-

$$S(n)=\{1,2,3,5,8,13,21,33,54,\dots,f[n]\}$$

The elements  $f[n]$  in this sequence are determined by a solution of the difference equation-

$$f[n+2]=f[n+1]+f[n] \quad \text{subject to } f[1]=1 \text{ and } f[2]=2$$

We have –

$$f[3] = f[1] + f[2] = 3$$

$$f[4] = f[1] + 2f[2] = 5$$

$$f[5] = 2f[1] + 3f[2] = 8$$

$$f[6] = 3f[1] + 5f[2] = 13$$

$$f[7] = 5f[1] + 8f[2] = 21$$

$$f[8] = 8f[1] + 13f[2] = 34$$

In matrix form this last set of equations may be written as-

$$\begin{bmatrix} 1 & 1 \\ 1 & 2 \\ 2 & 3 \\ 3 & 5 \\ 5 & 8 \\ 8 & 13 \end{bmatrix} \cdot \begin{bmatrix} f[1] \\ f[2] \end{bmatrix} = \begin{bmatrix} f[3] \\ f[4] \\ f[5] \\ f[6] \\ f[7] \\ f[8] \end{bmatrix}$$

The solutions to this equation are the Fibonacci Numbers  $f[3]=3$ ,  $f[4]=5$ ,  $f[5]=8$ ,  $f[6]=13$ ,  $f[7]=21$ ,  $f[8]=34$ . Other sets of  $f[n]$  values can be found by replacing the starting conditions  $[1 \ 2]^T$  by say  $[1 \ 3]^T$ . This change leads to the Lucas Numbers  $\{1,3,4,7,11,18,29,47,\dots\}$ . Regardless of the starting conditions  $[f[1] \ f[2]]^T$  the ratio of  $f[n+1]/f[n]$  as  $n$  goes to infinity equals the golden ratio  $\phi=(1+\sqrt{5})/2=1.6180339\dots$  .

The purpose of this note is to look at some variations of the Fibonacci Sequence which appear not to have received attention in the literature. One such a modification is governed by the finite difference equation-

$$f[n+4]=f[n+1]+f[n+2]+f[n+3] \quad \text{subject to the starting values } f[1],f[2] , \text{ and } f[3] .$$

The solution to this difference equation, good through  $f[9]$ , can be found in solving this given in matrix form -

$$\begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 2 \\ 2 & 3 & 4 \\ 4 & 6 & 7 \\ 7 & 11 & 13 \\ 13 & 20 & 24 \end{bmatrix} \cdot \begin{bmatrix} f[1] \\ f[2] \\ f[3] \end{bmatrix} = \begin{bmatrix} f[4] \\ f[5] \\ f[6] \\ f[7] \\ f[8] \\ f[9] \end{bmatrix}$$

One can read off at once that  $f[8]=7f[1]+11f[2]+13f[3]$ . So if we set  $f[1]=1, f[2]=2$  and  $f[3]=3$ , one finds  $f[8]=68$ . The elements in this 6 by 3 matrix are generated as follows-

$$a[n,3] = a[n+1,1] \quad a[n,1]+a[n,3]=a[n+1,2] \quad a[n,2]+a[n,3]=a[n+1,3]$$

So the elements in row  $n=5$  become 7,  $4+7=11$  and  $6+7=13$ . The elements in the 7<sup>th</sup> row would be  $[24,37,44]$  and in the 8<sup>th</sup> row would be  $[44,68,81]$ . For the specific starting conditions  $f[1]=1, f[2]=2$  and  $f[3]=3$ , the solution sequence reads-

$$S=\{1,2,3,6,11,20,37,68,125\}$$

By increasing the number of rows in the left matrix above one gets the longer sequence-

$$S=\{1,2,3,6,11,20,37,68,125,230,423,778,1431,2632,4841,8904,16377,30122,\dots\}$$

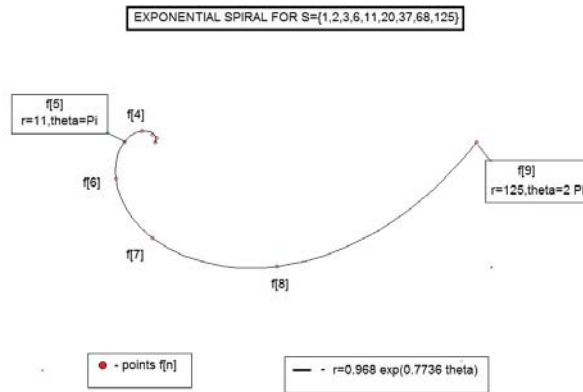

The ratio  $R=f[n+1]/f[n]$  of neighboring  $f$ s is given by looking at the ratio of neighboring elements in  $S$ . For the largest elements shown above we get  $R=30122/16377=1.8392868$ . Using my PC the calculator  $f[200]$  and  $f[199]$  we get an improved ratio-

$$R=1.839286755214161132551852564653286600424178746097592246778758\dots$$

Note that this value is independent of the three starting values  $\{f[1], f[2], f[3]\}$ . Here  $R$  plays the same role as does the golden ratio for the standard Fibonacci Sequence. Monotonically increasing sequences such as  $S$  above can be represented graphically as exponential spirals when neighboring elements are separated by a specified angle from each other. For  $S=\{1,2,3,6,11,20,37,68,125\}$  we can use the exponential representation -

$$r=a \exp(-b\theta) \quad \text{with } b=(1/\pi)\ln(125/11) \quad \text{and } a=11 \exp(-b\pi)$$

provided that the angle separation between  $f[n+1]$  and  $f[n]=\pi/4$ . Here is the corresponding graph-

As another variation on the Fibonacci Sequence, consider the difference equation-

$$f[n+5] = f[n+1] + f[n+2] + f[n+3] + f[n+4] \quad \text{subject to } f[1]=1, f[2]=2, f[3]=3 \text{ and } f[4]=4$$

Here the first few terms in the corresponding sequence are –

$$S = \{ 1, 2, 3, 4, 10, 19, 36, 69, 134, 258, 437, \dots \}$$

The corresponding coefficient matrix reads-

$$M = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 2 & 2 & 2 \\ 2 & 3 & 4 & 4 \\ 4 & 6 & 7 & 8 \\ 8 & 12 & 14 & 15 \\ 15 & 23 & 27 & 29 \end{bmatrix}$$

The elements  $a[n,m]$  in this matrix are easy to find. We have-

$$a[n,4] = a[n+1,1] \quad a[n,1] + a[n,4] = a[n+1,2] \quad a[n,2] + a[n,4] = a[n+1,3] \quad a[n,3] + a[n,4] = a[n+1,4]$$

So that the next row in the above matrix reads [29,44,52,56]. It says that-

$$f[11] = 29(1) + 44(2) + 52(3) + 56(4) = 497$$

The ratio of  $f[n+1]/f[n]$  as  $n$  gets large yields-

$$R = := 1.92756197548292530426190586173662216869855425516338472714664703\dots$$

One suspects that this ratio will reach  $R=2$  for a difference equation of the form-

$$f[n + m] = \sum_{k=1}^{m-1} f[n + k] \quad \text{as } m \text{ goes to infinity}$$

This observation follows from the fact that  $1.618 < 1.839 < 1.927$ .
